

*Combine Mobile, IM, and Data Conferencing,
with the leading media processor platform with
CONTEX Converged Collaboration*

CONTEX Converged Collaboration

When it comes to critical communications you need to know that your applications have been developed and tested by a company with the experience and the expertise to deliver reliable solutions. Compunetix stands as the only independent collaboration developer and manufacturer with the know-how to deliver seamlessly integrated applications developed together on the industry's leading VoIP/TDM Concentrated Media Processor. Our suite of applications built on the CONTEX Summit platform delivers a converged solution composed of mobile, instant messenger, data-sharing, and voice conferencing technologies that is reliable, flexible, and powerful.

Leverage presence and availability

Seamlessly launch data sharing

Reach people from anywhere

Highest quality voice collaboration

CONTEX Mobile Groups™

This is a full featured business and personal conferencing application that is designed to leverage the power of the mobile network. CONTEX Mobile Groups can utilize either group blast, which is an instant ad-hoc dial-out conference, or instant meet-me, which uses automatic mobile identification number (MIN) detection and set-up. CONTEX Mobile can also use your device's integrated directory to send an SMS invitation to your mobile contacts.

CONTEX Messenger™

As IM becomes a critical form of communication, especially for corporate users, Compunetix has integrated Instant Messaging with the CONTEX platform to provide on-demand conferencing with instant participant notification and easy, text base control. CONTEX Messenger can be applied to both the business and consumer markets because it is simple and easy-to-use. And it gives the user the advantage of IP and mobile presence.

The simple text-based commands are initiated from the IM client (AOL, MSN, for example) with no special software downloads and with simple integration with the CONTEX system using the standard CONTEX SDK.

CONTEX Presenter™

CONTEX Presenter is designed to work with the CONTEX Summit®, seamlessly integrating audio controls directly into the application. Data session participants can be easily linked to an audioconference directly from CONTEX Presenter. Audio features include a complete list of audio participants; the ability to link audio and data participants; playing roll-call, party count, and participant name; audio controls like mute/unmute, call/disconnect, and hold/join; and the ability to start and stop session recording at anytime.

CONTEX Presenter can be easily extended to incorporate and leverage the CONTEX system's more advanced conferencing and collaboration features, giving your customers a truly powerful, flexible and customizable collaboration experience.

CONTEX Summit®

The CONTEX Summit® is the VoIP/TDM audio platform driving the next phase in IP collaboration convergence. Scalable to nearly 10,000 ports of superior-quality audioconferencing, the CONTEX Summit fully supports automated, on-demand conference calls as well as agent-assisted, multi-service high-touch events. The CONTEX Summit system features fully hybrid audio summation, on-board audio recording, standards-based interfaces for full integration/interoperability and widely deployed system APIs.

The CONTEX Summit represents the very best value for enterprises, telecommunication companies, conferencing service providers and other suppliers of large-scale collaboration services. Unlike multiple vendor solutions derived from general purpose IP media ports, Compunetix delivers both the hardware platform and the advanced applications. Our customers are presented with a tightly integrated solution with no single point of failure and full system maintenance/upgrades — all backed by a world-class organization for geographically dispersed deployment support. We're a single dedicated, integrated organization focused on assisting you with growing your business, not growing your frustration.

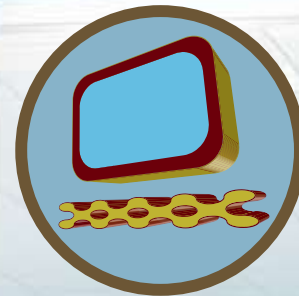

How it works:

Taken together these integrated applications let you offer your clients an easy-to-use, converged collaboration environment that is ideally suited for emergencies, alerting, and crisis communications. Critical communications can be initiated using the mobile network, SMS notification, and instant messaging; participants can be instantaneously joined to audio and data collaboration sessions; and you can offer your customer the piece or mind that comes with industry's most reliable system.

All of this automated communication can be backed up by a fully-staffed command center using the CONTEX Summit's industry-standard operations interfaces, giving your customers even greater security and assurance that their communications will be reliable, secure, and easy-to-use.
